XTech Gear is capable of offering repair on all

manner of Integrated Access Devices (IAD), such as Cisco IAD2431 series and the Adtran 6xx series as well as numerous other customer premise equipment.

Our fully functional testing facility allows us to test all IAD connectivity, including T1, ADSL, T3, Gigabit Ethernet and Optical connections. We utilize our in service switches and network to ensure that all ports on both the customer and the network side are functional and are passing voice, data and other media properly.

Our trained technicians are also able to diagnose and repair any issue that is encountered down to the component level and to effect any repair or parts replacement necessary to return the equipment to full service status. This allows a higher utilization of your investment in your network assets, as you are able to return once non-functional units back to full service.

If you would like additional information regarding our ability to repair Central Office or Customer Premise Equipment, please feel free to
contact an XTech Gear, Inc. representative
at any time!
