

Providing simple connectivity to remote sites is no longer sufficient as business requirements shift from discrete voice and data communication solutions to a more sophisticated model that requires an integrated approach. The Cisco 7200VXR Series Router is the ideal system to deploy at central locations to facilitate the aggregation of data and voice traffic from remote sites. It combines flexibility and reliability with an unrivaled feature set that complements the extensive capabilities of the latest generation of integrated services routers.

All equipment that enters our facility for testing or repair is entered into our equipment tracking system, and the board's status is updated as our technicians go through testing procedures on the circuit pack. You are able to check the status of your equipment at any time via our web based Repair Portal, or by contacting one of our repair representatives.

The following is a list of Cisco 7200vvr equipment that we test and repair. Please note that repair costs are associated with the manner of the problem, and while we are able to generally provide a rough estimate, a complete estimate will not be able to be issued until we are able to test the circuit board in our internal labs.

- PE300
